Tour of the Terminal:
Using Unix or Mac OS X Command Line

- Introduction
- Files
- Directories
- Commands
- Shell Programs
- Stream Editor: sed

Introduction

- Operating Systems
- Command-Line Interface
- Shell
- Unix Philosophy
- Command Execution Cycle
- Command History

Command-Line Interface

user
(human)

operating system
(software)

computer
(hardware)

command-line interface

point-and-click (gui) interface

programs
(text editors, compilers, commands for working with file system, many other utilites)

kernel
(manages computing resources:
  - memory
  - hard-drive
  - time)

cpu
memory
hard-drive

Comparison

command-line interface	point-and-click interface
- may have steeper learning curve, BUT provides constructs that can make many tasks very easy	- may be more intuitive, BUT can also be much more human-manual-labor intensive
- scales up very well when have lots of: data programs tasks to accomplish	- often does not scale up well when have lots of: data programs tasks to accomplish

Shell

Command-line interface provided by Unix and Mac OS X is called a shell
a shell:

      - prompts user for commands
      - interprets user commands
      - passes them onto the rest of the operating system which is hidden from the user

How do you access a shell ?

  - if you have an account on a machine running Unix or Linux , just log in.
       A default shell will be running.

  - if you are using a Mac, run the Terminal app.   -if Terminal app does not
      A default shell will be running.   appear on the Shortcut Bar:
   Go -> Applications ->
                                                    Utilities -> Terminal

Examples of Operating Systems

Unix   MS Windows

AT&T System V Unix   Berkeley Unix   Windows 95
                                              Windows 98
                                              Windows XP
GNU Linux   Mac OS X   Windows 7
                                              Windows 8

- Even though there are differences between the various Unix operating systems, for the most part, we are going to ignore those differences, and just refer to "Unix" operating systems because the principles are largely the same.

- There are also many different Unix shells that are more alike than different:
  - sh (original Unix shell, by Stephen Bourne) `/bin/sh`
  - ksh (similar to sh, by David Korn) `/bin/ksh`
  - bash (Bourne again shell, part of GNU project) `/bin/bash`
  - csh (part of Berkely Unix, intended to by C-like, by Bill Joy) `/bin/csh`
  - tcsh (based on and compatible with csh) `/bin/tcsh`

`echo $SHELL`

Unix Philosophy

- provide <u>small</u> programs that do <u>one thing well</u>
                       and
 provide mechanisms for <u>joining programs together</u>

 - "silence is golden"
    when a program has nothing to say, it shouldn't say anything

- users are very intelligent and <u>do what they intend to do</u>

Examples of Tasks for Command-Line Interface

data management:
- two types of administrative data – millions of observations of each type
- need to standardize addresses for merging (or fuzzy matching)

file management
- check number of lines in large file downloaded from the web

file management:
- split huge files into subsets that are small enough to be read into memory

basic web scraping
- list of names and dates of OPR computing workshops

basic web scraping
- list of UN countries and dates they became members

Recent Medicare Data Release

Recent Medicare Data Release

Data available in two formats:

- tab delimited file format (requires importing into database or statistical software; SAS® read-in language is included in the download ZIP package)

   Note: the compressed zip file contains a tab delimited data file
   which is 1.7GB uncompressed and contains more than 9 million records,
   thus importing this file into Microsoft Excel will result in an incomplete
   loading of data. Use of database or statistical software is required;
   a SAS® read-in statement is supplied.

- Microsoft Excel format (.xlsx), split by provider last name
   (organizational providers with name starting with a numeric are available in the "YZ" file)

Recent Medicare Data Release

```
$ unzip Medicare-Physician-and-Other-Supplier-PUF-CY2012.zip

$ wc -l Medicare-Physician-and-Other-Supplier-PUF-CY2012.txt
9153274   Medicare-Physician-and-Other-Supplier-PUF-CY2012.txt

$ tr "\t" "|" < Medicare-Physician-and-Other-Supplier-PUF-CY2012.txt  > medicare.pipe.txt

$ rm Medicare-Physician-and-Other-Supplier-PUF-CY2012.txt

$ head -1 medicare.pipe.txt
```

npi|**nppes_provider_last_org_name**|nppes_provider_first_name|nppes_provider_mi|
nppes_credentials|nppes_provider_gender|nppes_entity_code|nppes_provider_street1|
nppes_provider_street2|**nppes_provider_city**|**nppes_provider_zip**|**nppes_provider_state**|
nppes_provider_country|**provider_type**|medicare_participation_indicator|place_of_service|

```
$ head medicare.pipe.txt

$ tail medicare.pipe.txt
```

Command Execution Cycle and Command Format

1. Shell prompts user
2. User inputs or recalls command ending with <CR>
3. Shell executes command

`$ command  [options]   [arguments]`

command
- first word on line
- name of program

options
- usually begin with -
- modify command behavior

arguments
- "object" to be "acted on" by command
- often directory name, file name, or character string

use `man` command for options & arguments of each command

use `PS1="$  "` to change prompt string

`$ date`

`$ who`

`$ who  -q`

`$ cal  2014`

`$ cal 8 2014`

`$ pwd`

`$ ls`

`$ mkdir  unix`

`$ cd unix`

`$ pwd`

`$ ls`

Using Command History

commands are saved and are available to recall

to re-execute a previously entered command:

       step 1. press ⬆ to scroll through previously entered commands
       step 2. press <CR> to execute a recalled command

          OR

to re-execute a previously entered command:
```
$ history
$ !<command number>
```

Files

- Displaying File Contents
- File Management Commands
- File Access and Permission
- Redirecting Standard Output to a File
- File Name Generation Characters

Files

file names:
- should not contain spaces or slashes
- should not start with + or –
- best to avoid special characters other than _ and .
- files with names that start with . will not appear in output of ls command

created by:
- copying an existing file
- using output redirection
- executing some Unix program or other application
- using a text editor
- downloading from the internet

```
$ pwd
/u/dkoffman/unix
$ wget  http://opr.princeton.edu/workshops/201401/wdata.gz   # NOT standard  on  OS X
                    **** OR ****
$ curl  http://opr.princeton.edu/workshops/201401/wdata.gz -o wdata.gz    # available on OS X

$ gunzip wdata.gz

$ ls
```

Displaying File Contents

$ `wc wdata`

$ `cat wdata`

$ `head wdata`

$ `head -1 wdata`

$ `tail wdata`

$ `tail -2 wdata`

$ `more wdata`

File Commands

```
$ cp  wdata  wdata.old

$ mv  wdata.old  wdata.save

$ cp  wdata  wdata_orig

$ cp  wdata  wdata_fromweb

$ rm  wdata_orig  wdata_fromweb

$ diff  wdata  wdata.save
```

File Access and Permission

```
$ ls  -l

-rw----|----|---    1   dkoffman   rpcuser   8586 Apr 1 14:46   wdata
-rw-------    1   dkoffman   rpcuser   8586 Apr 1 14:27   wdata.save
```

User classes

    owner (user) = u
    group = g
    other = o
    all = a

File permissions

    read (cat, tail, cp, …) = r
    write (vi, emacs) = w
    execute (run program) = x

```
$ chmod  g+w   wdata

$ ls -l

$ chmod  go-r  wdata.save

$ ls -l
```

Redirecting Standard Output

most commands display output on terminal screen

`$ date`

command output can be redirected to a file

`$ date > date.save`
`$ cat date.save`

*** note: output redirection using > <u>overwrites</u> file contents if file already exists

`$ date > date.save`
`$ cat date.save`

use `>>` to <u>append</u> output to any existing file contents (rather than overwrite file)

`$ date >> date.save`
`$ cat date.save`

File Name Generation Characters

shell can automatically put file names
on a command line if user uses
<u>file name generation characters</u>

?   any single character   `$ cat s?`

*   any number of any characters   `$ ls b*`
        (including 0)

                                      `$ ls *.R`

                                      `$ wc -l *.do`

                                      `$ ls *.dta`

   `$ ls check_*.do`

[...] any <u>one</u> of a group of characters   `$ rm s[4-7]`

Directories

- Directory Tree
- Pathnames: Absolute and Relative
- Copying, Moving and Removing Files & Directories

Directory Tree

`pwd`   shows you where you are (present working directory)

`cd`   makes your "home" (login) directory your current directory

Changing Directory

absolute pathnames

```
$ pwd
$ cd /etc
$ cat passwd
$ cd /bin
$ ls e*
$ ls f*
$ cd /usr/bin
$ ls e*
$ ls f*
$ cd /u/dkoffman
$ cd /u/dkoffman/unix
```

relative pathnames

```
$ pwd
$ cd ../../../etc
$ cat passwd
$ cd ../bin
$ ls e*
$ ls f*
$ cd ../usr/bin
$ ls e*
$ ls f*
$ cd
$ cd  unix
```

.. refers to the parent directory

Accessing Files

absolute pathnames

$ `pwd`

$ `cat /etc/passwd`

$ `ls /bin/e*`
$ `ls /bin/f*`

$ `ls /usr/bin/e*`
$ `ls f*`
$ `pwd`

relative pathnames

$ `pwd`

$ `cat ../../../etc/passwd`

$ `ls ../../../bin/e*`
$ `ls ../../../bin/f*`

$ `ls ../../../usr/bin/e*`
$ `ls ../../../usr/bin/f*`
$ `pwd`

.. refers to the parent directory

Copying Files

```
$ cp date.save   date.save2
$ mkdir   savedir
$ cp  *.save*   savedir
```

list of files

```
$ cd savedir
$ ls
$ cp date.save2   date.save3
$ cp date.save3 ..

$ ls  ..
$ cp date.save2   date.save4
$ cd ..
$ cp savedir/date.save4   .
```
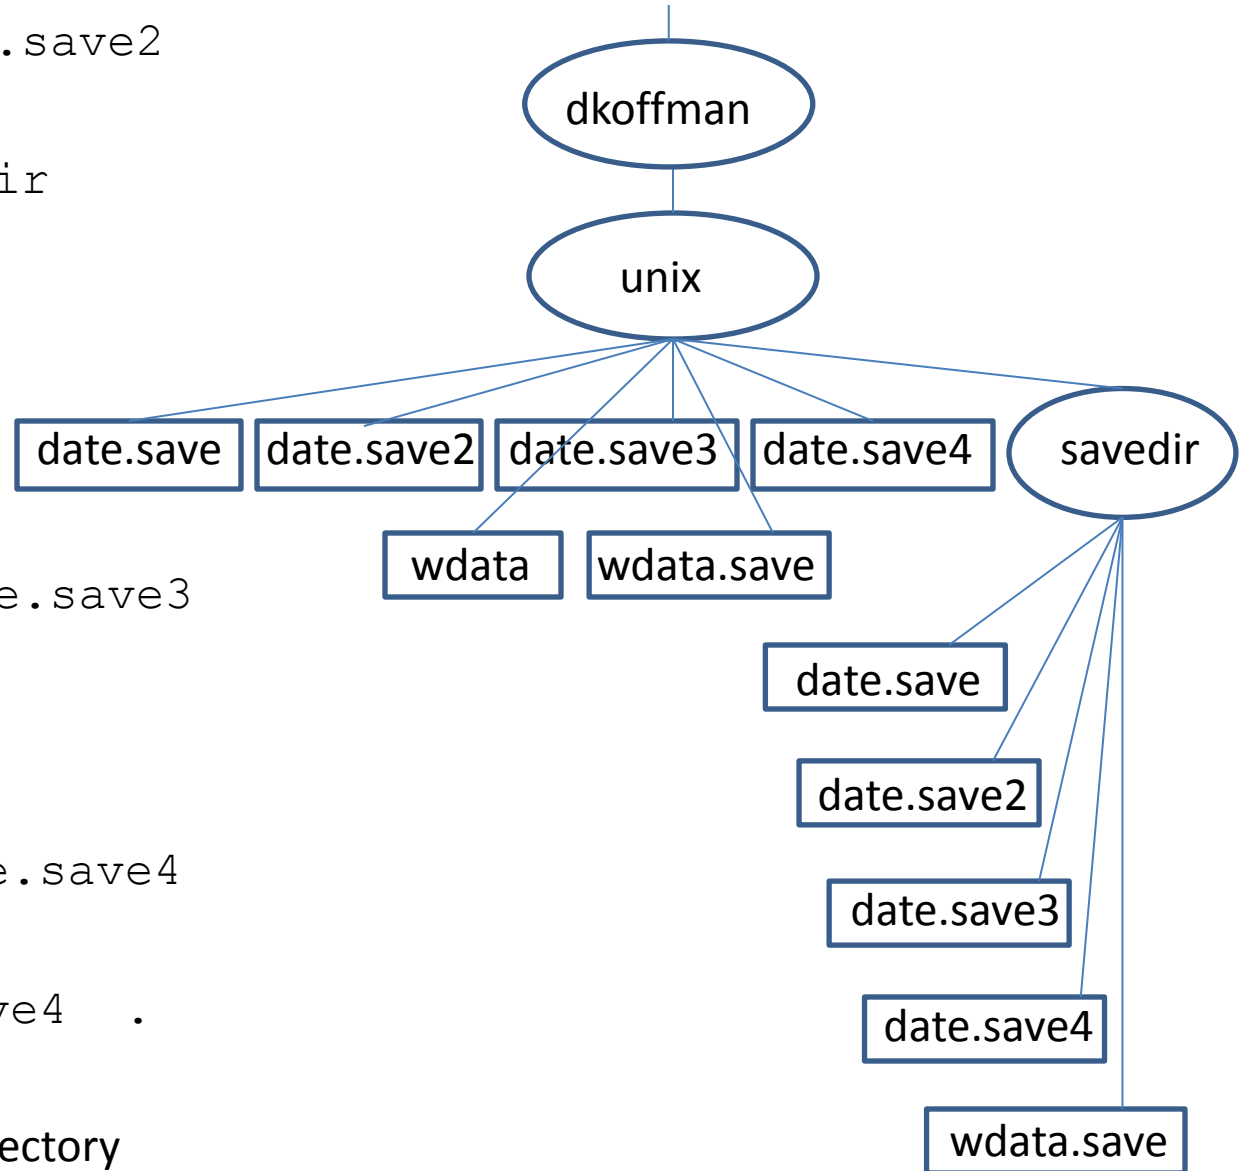

. refers to the current directory

Moving Files

```
$ cp date.save   date4move
$ mv date4move   date.4move
$ ls
$ mkdir movedir
$ mv date.4move movedir
$ ls
$ ls movedir

$ mv date.save[23]   movedir
```

list of files

```
$ ls
$ cd movedir
$ ls
$ mv  ../date.save   .
$ ls
$ cd ..
```
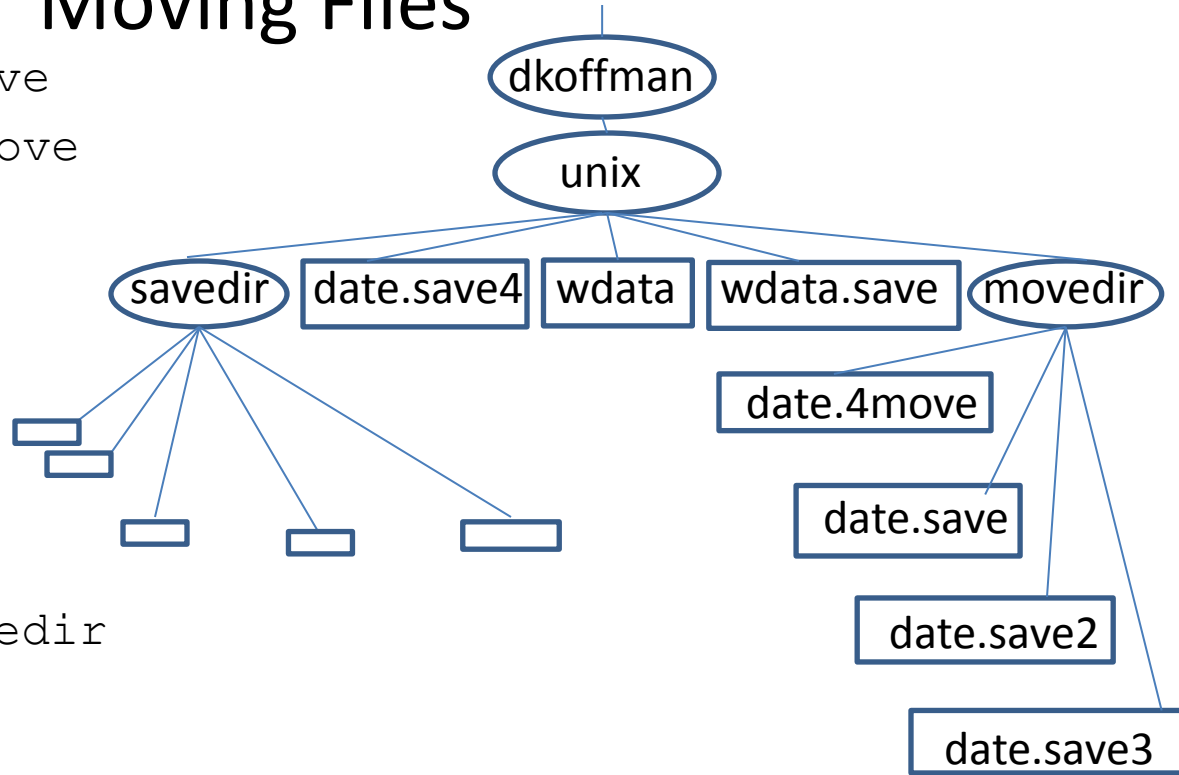

Removing Files and Directories

```
$ cd
$ cd unix
$ rm date.save4 wdata.save
$ rmdir movedir
```
rmdir: failed to remove 'movedir':

Directory not empty
```
$ ls movedir
$ rm movedir/*    # BE CAREFUL!
$ rmdir movedir

$ rm savedir/date*
$ ls savedir
$ ls
```
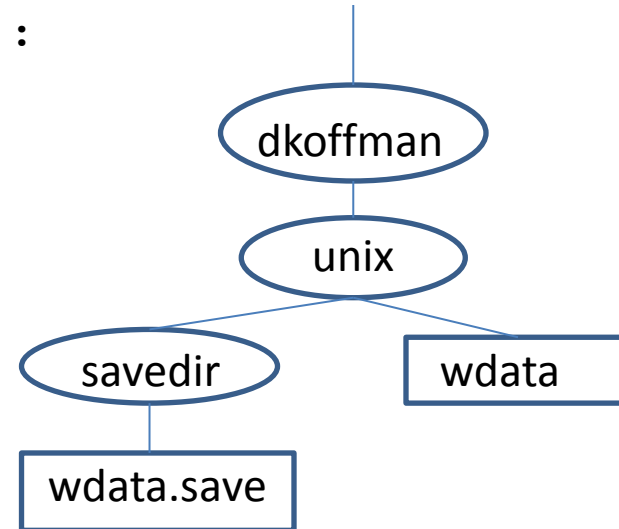

Commands

- Review of Commands
- More Commands
- Sequential Execution
- Command Grouping
- Pipelines
- Foreground/Background Command Execution

Review of Commands

date	gunzip
who	cat
cal	head
pwd	tail
ls	more
mkdir	cp
cd	mv
history	rm
curl	diff
wget	chmod
	rmdir

More Commands

```
$ tail -40 wdata

$ sort wdata

$ tail -40 wdata

$ sort wdata > wdata.sort

$ more wdata.sort

$ sort -r wdata > wdata.revsort

$ more wdata.revsort

$ wc wdata

$ wc -l wdata

$ wc -wc wdata
```

More Commands

```
$ head wdata

$ cut -d"," -f1 wdata

$ head wdata

$ cut -d"," -f1 wdata > wdata.countries

$ cut -c1,3-4 wdata

$ cut -d"," -f5 wdata > wdata.le

$ paste wdata.le  wdata.countries

$ sort wdata.le > wdata.le.sort

$ uniq wdata.le.sort

$ uniq -c wdata.le.sort
```

More Commands

```
$ grep ",Oceania," wdata

$ grep ",Central America," wdata > wdata.centralamerica

$ grep pop2012 wdata

$ grep pop2012 wdata > wdata.hd

$ grep -v pop2012 wdata > wdata.clean

$ head wdata.clean

$ wc -l wdata.clean

$ grep  -n ",Oceania,"  wdata.clean

$ grep -n -i ",oceania,"  wdata.clean
```

Regular Expressions

describe a sequence of characters (pattern) to be matched

<u>basics</u>

. (dot)   matches any single character: 1.6

[ ] (brackets)   match any one of the enclosed characters: [aeiou]
                            can use – (dash) to indicate at range of characters: [A-Za-z] [24-6]

[^]   match any character **except** the enclosed characters: [^Zz]

 * (asterisk)   matches zero or more of the preceding character: b* vs   bb*

 ^ (caret)   pattern must occur at the beginning of a line (anchor): ^ABC

 $ (dollar sign)   pattern must occur at the end of a line (anchor): ABC$ vs ^ABC$

 \ (backslash)   turns off (escapes) the special meaning of the next character: \.*

enclose regular expressions in single quotes to stop shell from expanding special characters

Using Regular Expressions

```
$ grep stan wdata.clean

$ grep '^B' wdata.clean

$ grep '^....,' wdata.clean

$ grep '/' wdata.clean

$ grep -i ira[qn] wdata.clean

$ grep '^.*,.*West' wdata.clean

$ grep '4.,[A-Z]' wdata.clean

$ grep '[56].,[A-Z]' wdata.clean

$ grep '[67].,[A-Z]..*Americas' wdata.clean
```

More Commands

```
$ split –l20 wdata.clean

$ ls

$ wc –l xa?

$ tail xah

$ cat xa? > wdata.clean.copy

$ wc –l wdata.clean.copy

$ tr "abcdefghijklmnopqrstuvwxyz" "ABCDEFGHIJKLMNOPQRSTUVWXYZ" < wdata

$ tr  [:lower:]  [:upper:]  < wdata.clean  > wdata.clean.uc

$ tr -d ':"' < wdata.clean

$ tr –s " "  < wdata.clean
```

Sequential Execution

```
cmd1 arg1 arg2 ...; cmd2 arg1 arg2 ...; cmd3 arg1 arg2  ...
```

- series of commands on a single line separated by semicolons

- commands are executed left-to-right, one at a time

```
$ sort wdata.clean > wdata.clean.s;  echo SORT DONE
```

Command Grouping

```
(cmd1 arg1 agg2 ...; cmd2 arg1 arg2 ...; cmd3 arg1 arg2 ...)
```

- allows several commands to be treated as <u>one</u> with respect to standard output

```
$ date > log

$ who am  i  >> log

$ (
> date
> who am i
> ) > log
$

$ (date; who am i) > log
```

Pipeline

```
cmd1 arg1 ... | cmd2 arg1 ... | cmd3 arg1 ...
```

- series of commands separated by |

- <u>output</u> of one command used as <u>input</u> for next command

- commands run in parallel when possible!

- avoids use of temporary files ... faster!

```
$ who | sort
```

```
$ who > tempfile
$ sort < tempfile
$ rm tempfile
```

Pipeline Examples

```
$ who | wc -l

$ ls -l | grep "^d"

$ grep Africa wdata.clean | sort

$ sort wdata.le | uniq | wc -l

$ grep Americas wdata.clean | cut -d"," -f5 | sort

$ grep Americas wdata.clean | cut -d"," -f5 | sort | uniq

$ grep Americas wdata.clean | cut -d"," -f5 | sort | uniq | wc -l

$ sort wdata.clean | tr [:lower:] [:upper:] | cut -d"," -f1

$ sort wdata.clean | cut -d"," -f1,5

$ sort wdata.clean | cut -d"," -f1,5 | tr -d '".:' | split -l20 - wdata_le_part_
```

Writing to a File And to Standard Output

tee command

       - reads from standard input

       - writes to a file and standard output

       - very useful for saving intermediate "results" in a pipeline

       - use –a option to append to a file rather than overwrite

```
$ sort wdata.le | uniq | tee wdata.le.uniq | wc -l

$ cat wdata.le.uniq

$ sort wdata.le | uniq | tee wdata.le.uniq | wc -l > le.uniq.count

$ cat le.uniq.count

$ sort wdata.clean | cut -d"," -f1,5 | tee c.le | split -l20 - wdata_le_part_

$ cat c.le
```

Foreground and Background Command Processing

Foreground command processing

- one command line must complete execution <u>before</u> next command line begins execution
- "normal" way commands are processed

Background command processing

- next command line begins execution <u>before</u> background command completes
- any standard output is usually redirected to a file
- <BRK> and <DEL> are ignored
- identification number is displayed after background command is entered ... process id
- can stop a command running in the background using the kill command and the process id

```
$ command  arg1  arg2  > outfile &
 10411                              execute command in the background
$ kill 10411
$
```

Background Command Processing

- normally, a hang-up signal (logging off) is <u>not</u> ignored by a command executing in the background, and will cause it to terminate

- <u>nohup</u> prefix allows a command to continue running even if a hang-up signal is received

```
$ nohup  cmd  arg1  arg2  ... &
```

- to check to see if a background command is still running and to obtain its process id,
  use ps command

Shell Programs

- Creating and Executing Shell Programs
- emacs Text Editor
- Adding Comments

How to Create and Execute a Shell Program

- Use a text editor such as emacs or vi to create a new file
- Enter a "shebang" (#!) indicating which shell (sh, bash, csh, ...) should execute the program
- Enter shell command lines (and optionally, shell control structures for branching and looping)
- Save the new file and exit the text editor

- Turn on execute permission for your new file
- Make sure the new file is in a directory where the shell looks for commands (PATH variable)

- Invoke the shell program by using the new file name as a command name

Text Editors

vi: visual text editor (wysiwyg) compared to older line-oriented editors (ex and ed)

   "moded" editor ... need to use a command to allow adding text to a file

  vim: vi improved

      has both a command line interface and a graphical user interface

 emacs: text editor known for being customizable and extensible

      nice interface to R, LaTex, C/C++

      "non-moded" editor ... entered text becomes part of file ...

               control sequences are used as editing commands

    aquamacs: "a modern editor based on emacs that makes Mac users feel at home"

*** here we briefly illustrate basic emacs, which is available on both Linux and Mac OS X

resources for learning emacs

  - interactive tutorial: within emacs, use `<CTRL>h t`

  - manual: http://www.gnu.org/software/emacs/manual/

  - aquamacs: http://aquamacs.org/

Basic emacs Text Editing Commands

enter emacs to edit existing file   `emacs <file.existing>`

enter emacs to create a new file   `emacs <file.new>`

save file   `<CTRL>x <CTRL>s`

exit emacs   `<CTRL>x <CTRL>c`

move cursor one character forward   `<CTRL>f`

move cursor one character backward   `<CTRL>b`

move cursor to next line   `<CTRL>n`

move cursor to previous line   `<CTRL>p`

delete current line   `<CTRL>k`

delete current character   `<CTRL>d` or `<Delete>` or `<Backspace>`

undo last edit   `<CTRL>u`

access help   `<CTRL>h`

access emacs interactive tutorial   `<CTRL>h t`

Creating and Executing a New Shell Program

```
$ emacs myprog
 #!/bin/bash
 echo hello
 date
 who am i
 echo have a good day
 <CTRL>x <CTRL>s
 <CTRL>x <CTRL>c
$ chmod +x myprog
$ echo ${PATH}
/usr/local/bin:/bin:/usr/bin
$ pwd
/u/dkoffman/unix
$ PATH=${PATH}:/u/dkoffman/unix
$ myprog
 hello
 Thu Apr 10 13:00:46 EDT 2014
 dkoffman  pts/80   2014-04-10  12:59  (abc-xyz-princeton.edu)
 have a good day
$
```

Comments

starts a comment

<CR> ends a comment

```
$ cat wdata_le_part_scan
#
# Output consists of the first 4 lines
# of all wdata_le_part_[a-z][a-z] files
# in the current directory.
#
# Output is placed in a single file
# called wdata_le_part_scan.out
# in the current directory.
#
#!/bin/bash
head -4 wdata_le_part_[a-z][a-z] > wdata_le_part_scan.out
$
```

Stream Editor: sed

- Examples
- File Containing Edits
- Selecting Lines
- Writing Lines to Separate Files
- Using sed to Create a sed Script

Stream Editor: sed

- modifies text files using a list of editing commands, modifications not performed interactively
- original files remain unchanged ... modified versions are written to standard output
- sed is a filter, works similar to `cut` and `tr`

```
$ sed "s/stan/STAN/" wdata.clean

$ sed "s/,/|/"   wdata.clean

$ sed "s/,/|/g"  wdata.clean

$ sed "s_/_~~_"   wdata.clean

$ sed -e "s/stan/STAN/" -e "s/,/|/g" -e "s_/_~~_"   wdata.clean

$ sed "s/,.*,//" wdata.clean

$ sed "s/,.*,/:/" wdata.clean
```

sed Example

```
$ cat oprworkshops
#!/bin/bash
curl –s  http://opr.princeton.edu/workshops/   -o wwpage
grep 'h5 class="title"' wwpage | sed –e 's_.*">__'  –e 's_</a.*__'  –e s/,// >wtitles
grep '>Date' wwpage | sed -e's/.*em>: //' -e's_</p>__' -es/,// -e's/;.*//' -e's/^[MWTFS].*day //' >wdates
paste -d"," wtitles  wdates | tee wtitlesdates.csv
rm wwpage  wtitles  wdates
$ oprworkshops

sed: Editing Select Lines Using Regular Expressions

-can specify which lines should be a "operated on" by sed commands using regular expressions

- lines containing a pattern
- range of line from first line up through a line containing a pattern
- range of lines from a line containing a pattern through the last line
- all lines between two lines containing particular patterns

```
$ sed "/^K/s/stan/STAN/" wdata.clean

$ sed "1,/^Kaz/ s/stan/STAN/" wdata.clean

$ sed "/^Kaz/,$ s/stan/STAN/" wdata.clean

$ sed "/Benin/,/Zimbabwe/ s/,/|/g"  wdata.clean
```

sed: Writing Lines to Separate Files

```
$ cat sedscript_w
/Africa/w wdata.Africa
/Europe/w wdata.Europe
/Americas/w wdata.Americas
/Asia.*Oceania/w wdata.Asia.Oceania
$ sed -n -f sedscript_w wdata.clean
$ wc -l wdata.clean wdata.Africa wdata.Europe wdata.Americas wdata.Asia.Oceania
     158 wdata.clean
      48 wdata.Africa
      36 wdata.Europe
      25 wdata.Americas
      49 wdata.Asia.Oceania
